Matrix HPP

Generated by Doxygen 1.9.8

Chapter 1

Matrix HPP - C++11 library for matrix class container and linear algebra computations

This library provides a self-contained and easy to use implementation of matrix container class. The main features include:

- Full template parameterization with support for both real and complex data-types.
- Lightweight and self-contained - single header, no dependencies outside of C++ standard library.
- C++11 based.
- Operator overloading for matrix operations like multiplication and addition.
- Support the basic linear algebra operations, including matrix inversion, factorization and linear equation solving.

1.1 Installation

Copy the `matrix.hpp` file into the include directory of your project.

1.2 Functionality

This library provides the following functionality (but is not limited to):

- Elementary operations: transposition, addition, subtraction, multiplication and element-wise product.
- Matrix determinant.
- Matrix inverse.
- Frobenius norm.
- LU decomposition.
- Cholesky decomposition.
- LDL decomposition.

- Eigenvalue decomposition.
- Hessenberg decomposition.
- QR decomposition.
- Linear equation solving.

For further details please refer to the documentation: matrix_hpp.pdf. The documentation is auto generated directly from the source code by Doxygen.

1.3 Hello world example

A simple hello world example is provided below. The program defines two matrices with two rows and three columns each, and initializes their content with constant values. Then, the matrices are added together and the resulting matrix is printed to stdout.

Note that the Matrix class is a template class defined within the Mtx namespace. The template parameter specifies the numeric type to represent elements of the matrix container.

```
#include <iostream>
#include "matrix.hpp"

void main() {
  Mtx::Matrix<double> A({ 1, 2, 3,
                          4, 5, 6}, 2, 3);

  Mtx::Matrix<double> B({ 7, 8, 9,
                         10,11,12}, 2, 3);

  auto C = A + B;

  std::cout « "A + B = [" « C « "];" « std::endl;
}
```

For more examples, refer to examples.cpp file. Remark that not all features of the library are used in the provided examples.

1.4 Tests

Unit tests are compiled with make tests.

1.5 License

MIT license is used for this project. Please refer to LICENSE for details.

Chapter 2

Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Chapter 4

File Index

4.1 File List

Here is a list of all documented files with brief descriptions:

Chapter 5

Class Documentation

5.1 Mtx::Eigenvalues_result< T > Struct Template Reference

Result of eigenvalues.

`#include <matrix.hpp>`

Public Attributes

- std::vector< std::complex< T > > **eig**

  Vector of eigenvalues.
- bool **converged**

  Indicates if the eigenvalue algorithm has converged to assumed precision.
- T **err**

  Error of eigenvalue calculation after the last iteration.

5.1.1 Detailed Description

template<typename T>
struct Mtx::Eigenvalues_result< T >

Result of eigenvalues.

This structure stores the result of matrix eigenvalue calculation, returned by eigenvalues() function.

The documentation for this struct was generated from the following file:

- matrix.hpp

5.2 Mtx::Hessenberg_result< T > Struct Template Reference

Result of Hessenberg decomposition.

`#include <matrix.hpp>`

Public Attributes

- Matrix< T > **H**

  Matrix with upper Hessenberg form.
- Matrix< T > **Q**

  Orthogonal matrix.

5.2.1 Detailed Description

template<typename T>
struct Mtx::Hessenberg_result< T >

Result of Hessenberg decomposition.

This structure stores the result of the Hessenberg decomposition, returned by hessenberg() function.

The documentation for this struct was generated from the following file:

- matrix.hpp

5.3 Mtx::LDL_result< T > Struct Template Reference

Result of LDL decomposition.

```
#include <matrix.hpp>
```

Public Attributes

- Matrix< T > **L**

  Lower triangular matrix.
- std::vector< T > **d**

  Vector with diagonal elements of diagonal matrix D.

5.3.1 Detailed Description

template<typename T>
struct Mtx::LDL_result< T >

Result of LDL decomposition.

This structure stores the result of LDL decomposition, returned by ldl() function.

The documentation for this struct was generated from the following file:

- matrix.hpp

5.4 Mtx::LU_result< T > Struct Template Reference

Result of LU decomposition.

```
#include <matrix.hpp>
```

Public Attributes

- Matrix< T > **L**

  Lower triangular matrix.
- Matrix< T > **U**

  Upper triangular matrix.

5.4.1 Detailed Description

template<typename T>
struct Mtx::LU_result< T >

Result of LU decomposition.

This structure stores the result of LU decomposition, returned by lu() function.

The documentation for this struct was generated from the following file:

- matrix.hpp

5.5 Mtx::LUP_result< T > Struct Template Reference

Result of LU decomposition with pivoting.

```
#include <matrix.hpp>
```

Public Attributes

- Matrix< T > **L**

  Lower triangular matrix.
- Matrix< T > **U**

  Upper triangular matrix.
- std::vector< unsigned > **P**

  Vector with column permutation indices.

5.5.1 Detailed Description

template<typename T>
struct Mtx::LUP_result< T >

Result of LU decomposition with pivoting.

This structure stores the result of LU decomposition with pivoting, returned by lup() function.

The documentation for this struct was generated from the following file:

- matrix.hpp

5.6 Mtx::Matrix< T > Class Template Reference

```
#include <matrix.hpp>
```

Public Member Functions

- Matrix ()
  Default constructor.
- Matrix (unsigned size)
  Square matrix constructor.
- Matrix (unsigned nrows, unsigned ncols)
  Rectangular matrix constructor.
- Matrix (T x, unsigned nrows, unsigned ncols)
  Rectangular matrix constructor with fill.
- Matrix (const T *array, unsigned nrows, unsigned ncols)
  Rectangular matrix constructor with initialization.
- Matrix (const std::vector< T > &vec, unsigned nrows, unsigned ncols)
  Rectangular matrix constructor with initialization.
- Matrix (std::initializer_list< T > init_list, unsigned nrows, unsigned ncols)
  Rectangular matrix constructor with initialization.
- Matrix (const Matrix &)
- virtual ∼Matrix ()
- Matrix< T > get_submatrix (unsigned row_first, unsigned row_last, unsigned col_first, unsigned col_last) const
  Extract a submatrix.
- void set_submatrix (const Matrix< T > &smtx, unsigned row_first, unsigned col_first)
  Embed a submatrix.
- void clear ()
  Clears the matrix.
- void reshape (unsigned rows, unsigned cols)
  Matrix dimension reshape.
- void resize (unsigned rows, unsigned cols)
  Resize the matrix.
- bool exists (unsigned row, unsigned col) const
  Element exist check.
- T * ptr (unsigned row, unsigned col)

Memory pointer.
- T ∗ ptr ()

  Memory pointer.
- void fill (T value)
- void fill_col (T value, unsigned col)

  Fill column with a scalar.
- void fill_row (T value, unsigned row)

  Fill row with a scalar.
- bool isempty () const

  Emptiness check.
- bool **issquare** () const

  Squareness check. Check if the matrix is square, i.e. the width of the first and the second dimensions are equal.
- bool isequal (const Matrix< T > &) const

  Matrix equality check.
- bool isequal (const Matrix< T > &, T) const

  Matrix equality check with tolerance.
- unsigned numel () const

  Matrix capacity.
- unsigned rows () const

  Number of rows.
- unsigned cols () const

  Number of columns.
- Matrix< T > transpose () const

  Transpose a matrix.
- Matrix< T > ctranspose () const

  Transpose a complex matrix.
- Matrix< T > & add (const Matrix< T > &)

  Matrix sum (in-place).
- Matrix< T > & subtract (const Matrix< T > &)

  Matrix subtraction (in-place).
- Matrix< T > & mult_hadamard (const Matrix< T > &)

  Matrix Hadamard product (in-place).
- Matrix< T > & add (T)

  Matrix sum with scalar (in-place).
- Matrix< T > & subtract (T)

  Matrix subtraction with scalar (in-place).
- Matrix< T > & mult (T)

  Matrix product with scalar (in-place).
- Matrix< T > & div (T)

  Matrix division by scalar (in-place).
- Matrix< T > & operator= (const Matrix< T > &)

  Matrix assignment.
- Matrix< T > & operator= (T)

  Matrix fill operator.
- operator std::vector< T > () const

  Vector cast operator.
- std::vector< T > **to_vector** () const
- T & operator() (unsigned nel)

  Element access operator (1D)
- T **operator()** (unsigned nel) const
- T & **at** (unsigned nel)

- T **at** (unsigned nel) const
- T & operator() (unsigned row, unsigned col)

  Element access operator (2D)
- T **operator()** (unsigned row, unsigned col) const
- T & **at** (unsigned row, unsigned col)
- T **at** (unsigned row, unsigned col) const
- void add_row_to_another (unsigned to, unsigned from)

  Row addition.
- void add_col_to_another (unsigned to, unsigned from)

  Column addition.
- void mult_row_by_another (unsigned to, unsigned from)

  Row multiplication.
- void mult_col_by_another (unsigned to, unsigned from)

  Column multiplication.
- void swap_rows (unsigned i, unsigned j)

  Row swap.
- void swap_cols (unsigned i, unsigned j)

  Column swap.
- std::vector< T > col_to_vector (unsigned col) const

  Column to vector.
- std::vector< T > row_to_vector (unsigned row) const

  Row to vector.
- void col_from_vector (const std::vector< T > &, unsigned col)

  Column from vector.
- void row_from_vector (const std::vector< T > &, unsigned row)

  Row from vector.

5.6.1 Detailed Description

template< typename T >
class Mtx::Matrix< T >

Matrix class definition.

5.6.2 Constructor & Destructor Documentation

5.6.2.1 Matrix() [1/8]

```
template<typename T >
Mtx::Matrix< T >::Matrix ( )
```

Default constructor.

Constructs an empty matrix with zero capacity, taking *rows* = 0 and *cols* = 0.

5.6.2.2 Matrix() [2/8]

```
template<typename T >
Mtx::Matrix< T >::Matrix (
            unsigned size )
```

Square matrix constructor.

Constructs a square matrix of size *size* x *size*. The content of the matrix is left uninitialized.

5.6.2.3 Matrix() [3/8]

```
template<typename T >
Mtx::Matrix< T >::Matrix (
            unsigned nrows,
            unsigned ncols )
```

Rectangular matrix constructor.

Constructs a matrix of size *nrows* x *ncols*. The content of the matrix is left uninitialized.

References Mtx::Matrix< T >::numel().

5.6.2.4 Matrix() [4/8]

```
template<typename T >
Mtx::Matrix< T >::Matrix (
            T x,
            unsigned nrows,
            unsigned ncols )
```

Rectangular matrix constructor with fill.

Constructs a matrix of size *nrows* x *ncols*. All of the matrix elements of are set to value *x*.

References Mtx::Matrix< T >::fill(), and Mtx::Matrix< T >::mult().

5.6.2.5 Matrix() [5/8]

```
template<typename T >
Mtx::Matrix< T >::Matrix (
            const T * array,
            unsigned nrows,
            unsigned ncols )
```

Rectangular matrix constructor with initialization.

Constructs a matrix of size *nrows* x *ncols*. The elements of the matrix are initialized using the elements stored in the input *array*. The elements of the matrix are filled in a column-major order.

References Mtx::Matrix< T >::mult(), and Mtx::Matrix< T >::numel().

5.6.2.6 Matrix() [6/8]

```
template<typename T >
Mtx::Matrix< T >::Matrix (
            const std::vector< T > & vec,
            unsigned nrows,
            unsigned ncols )
```

Rectangular matrix constructor with initialization.

Constructs a matrix of size *nrows* x *ncols*. The elements of the matrix are initialized using the elements stored in the input std::vector. Size of the vector must be equal to the number of matrix elements. The elements of the matrix are filled in a column-major order.

Exceptions

std::runtime_error	when the size of initialization vector is not consistent with matrix dimensions

References Mtx::Matrix< T >::mult(), and Mtx::Matrix< T >::numel().

5.6.2.7 Matrix() [7/8]

```
template<typename T >
Mtx::Matrix< T >::Matrix (
            std::initializer_list< T > init_list,
            unsigned nrows,
            unsigned ncols )
```

Rectangular matrix constructor with initialization.

Constructs a matrix of size *nrows* x *ncols*. The elements of the matrix are initialized using the elements stored in the input std::initializer_list. Size of the vector must be equal to the number of matrix elements. The elements of the matrix are filled in a column-major order.

Exceptions

std::runtime_error	when the size of initialization list is not consistent with matrix dimensions

References Mtx::Matrix< T >::mult(), and Mtx::Matrix< T >::numel().

5.6.2.8 Matrix() [8/8]

```
template<typename T >
Mtx::Matrix< T >::Matrix (
            const Matrix< T > & other )
```

Copy constructor.

References Mtx::Matrix< T >::mult().

5.6.2.9 ∼Matrix()

```
template<typename T >
Mtx::Matrix< T >::∼Matrix ( )  [virtual]
```

Destructor.

5.6.3 Member Function Documentation

5.6.3.1 add() [1/2]

```
template<typename T >
Matrix< T > & Mtx::Matrix< T >::add (
            const Matrix< T > & m )
```

Matrix sum (in-place).

Calculates a sum of two matrices $A + B$. A and B must be the same size. Operation is performed in-place by modifying elements of the matrix.

Exceptions

std::runtime_error	when matrix dimensions do not match

References Mtx::Matrix< T >::cols(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::operator+=(), and Mtx::operator+=().

5.6.3.2 add() [2/2]

```
template<typename T >
Matrix< T > & Mtx::Matrix< T >::add (
              T s )
```

Matrix sum with scalar (in-place).

Adds a scalar *s* to each element of the matrix. Operation is performed in-place by modifying elements of the matrix.

5.6.3.3 add_col_to_another()

```
template<typename T >
void Mtx::Matrix< T >::add_col_to_another (
              unsigned to,
              unsigned from )
```

Column addition.

Adds values of elements in column *from* to the elements of column *to*. The elements in column *from* are unchanged.

Exceptions

std::out_of_range	when column index is out of range

5.6.3.4 add_row_to_another()

```
template<typename T >
void Mtx::Matrix< T >::add_row_to_another (
              unsigned to,
              unsigned from )
```

Row addition.

Adds values of elements in row *from* to the elements of row *to*. The elements in row *from* are unchanged.

Exceptions

std::out_of_range	when row index is out of range

5.6.3.5 clear()

```
template<typename T >
void Mtx::Matrix< T >::clear ( )  [inline]
```

Clears the matrix.

De-allocates the memory reserved for matrix storage and sets the matrix size to 0.

References Mtx::Matrix< T >::resize().

5.6.3.6 col_from_vector()

```
template<typename T >
void Mtx::Matrix< T >::col_from_vector (
            const std::vector< T > & vec,
            unsigned col )  [inline]
```

Column from vector.

Assigns values of elements of a column *col* to the values stored in the input vector. Size of the vector must be equal to the number of rows of the matrix.

Exceptions

std::runtime_error	when std::vector size is not equal to number of rows
std::out_of_range	when column index out of range

5.6.3.7 col_to_vector()

```
template<typename T >
std::vector< T > Mtx::Matrix< T >::col_to_vector (
            unsigned col ) const  [inline]
```

Column to vector.

Stores elements from column *col* to a std::vector.

Exceptions

std::out_of_range	when column index is out of range

5.6.3.8 cols()

```
template<typename T >
unsigned Mtx::Matrix< T >::cols ( ) const  [inline]
```

Number of columns.

Returns the number of columns of the matrix, i.e. the value of the second dimension.

Referenced by Mtx::Matrix< T >::add(), Mtx::add(), Mtx::add(), Mtx::adj(), Mtx::circshift(), Mtx::cofactor(), Mtx::div(), Mtx::householder_reflection(), Mtx::Matrix< T >::isequal(), Mtx::Matrix< T >::isequal(), Mtx::istril(), Mtx::istriu(), Mtx::kron(), Mtx::lu(), Mtx::lup(), Mtx::make_complex(), Mtx::make_complex(), Mtx::mult(), Mtx::mult(), Mtx::mult(), Mtx::mult(), Mtx::Matrix< T >::mult_hadamard(), Mtx::mult_hadamard(), Mtx::operator<<(), Mtx::permute_cols(), Mtx::permute_rows(), Mtx::pinv(), Mtx::qr_householder(), Mtx::qr_red_gs(), Mtx::repmat(), Mtx::Matrix< T >::set_submatrix(), Mtx::solve_tril(), Mtx::solve_triu(), Mtx::Matrix< T >::subtract(), Mtx::subtract(), Mtx::subtract(), Mtx::tril(), and Mtx::triu().

5.6.3.9 ctranspose()

```
template<typename T >
Matrix< T > Mtx::Matrix< T >::ctranspose ( ) const  [inline]
```

Transpose a complex matrix.

Returns a matrix that is a conjugate (Hermitian) transposition of an input matrix.
Conjugate transpose applies a conjugate operation to all elements in addition to matrix transposition.

References Mtx::cconj().

Referenced by Mtx::ctranspose().

5.6.3.10 div()

```
template<typename T >
Matrix< T > & Mtx::Matrix< T >::div (
            T s )
```

Matrix division by scalar (in-place).

Divides each element of the matrix by a scalar s. Operation is performed in-place by modifying elements of the matrix.

Referenced by Mtx::operator/=().

5.6.3.11 exists()

```
template<typename T >
bool Mtx::Matrix< T >::exists (
            unsigned row,
            unsigned col ) const  [inline]
```

Element exist check.

Returns true if the element with specified coordinates exists within the matrix dimension range.
For example, calling *exist(4,0)* on a matrix with dimensions *2* x *2* shall yield false.

5.6.3.12 fill()

```
template<typename T >
void Mtx::Matrix< T >::fill (
            T value ) [inline]
```

Fill with a scalar. Set all the elements of the matrix to a specified value.

Referenced by Mtx::Matrix< T >::Matrix().

5.6.3.13 fill_col()

```
template<typename T >
void Mtx::Matrix< T >::fill_col (
            T value,
            unsigned col ) [inline]
```

Fill column with a scalar.

Set all the elements in a specified column of the matrix to a specified value.

Exceptions

std::out_of_range	when column index is out of range

5.6.3.14 fill_row()

```
template<typename T >
void Mtx::Matrix< T >::fill_row (
            T value,
            unsigned row ) [inline]
```

Fill row with a scalar.

Set all the elements in a specified row of the matrix to a specified value.

Exceptions

std::out_of_range	when row index is out of range

5.6.3.15 get_submatrix()

```
template<typename T >
Matrix< T > Mtx::Matrix< T >::get_submatrix (
            unsigned row_first,
            unsigned row_last,
            unsigned col_first,
            unsigned col_last ) const
```

Extract a submatrix.

Constructs a submatrix using the specified range of row and column indices. The submatrix contains a copy of elements placed between row indices indicated by *row_first* and *row_last*, and column indices *col_first* and *col_last*. Both index ranges are inclusive.

Exceptions

std::out_of_range	when row or column index is out of range of matrix dimensions

Referenced by Mtx::qr_red_gs().

5.6.3.16 isempty()

```
template<typename T >
bool Mtx::Matrix< T >::isempty ( ) const  [inline]
```

Emptiness check.

Check if the matrix is empty, i.e. if both dimensions are equal zero and the matrix stores no elements.

5.6.3.17 isequal() [1/2]

```
template<typename T >
bool Mtx::Matrix< T >::isequal (
            const Matrix< T > & A ) const
```

Matrix equality check.

Returns true, if both matrices are the same size and all of the element are equal value.

References Mtx::Matrix< T >::cols(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::operator!=(), and Mtx::operator==().

5.6.3.18 isequal() [2/2]

```
template<typename T >
bool Mtx::Matrix< T >::isequal (
            const Matrix< T > & A,
            T tol ) const
```

Matrix equality check with tolerance.

Returns true, if both matrices are the same size and all of the element are equal in value under assumed tolerance. The tolerance check is performed for each element: $tol < |A_{i,j} - B_{i,j}|$.

References Mtx::Matrix< T >::cols(), Mtx::Matrix< T >::numel(), and Mtx::Matrix< T >::rows().

5.6.3.19 mult()

```
template<typename T >
Matrix< T > & Mtx::Matrix< T >::mult (
            T s )
```

Matrix product with scalar (in-place).

Multiplies each element of the matrix by a scalar s. Operation is performed in-place by modifying elements of the matrix.

Referenced by Mtx::Matrix< T >::Matrix(), Mtx::Matrix< T >::Matrix(), Mtx::Matrix< T >::Matrix(), Mtx::Matrix< T >::Matrix(), Mtx::Matrix< T >::Matrix(), and Mtx::operator*=().

5.6.3.20 mult_col_by_another()

```
template<typename T >
void Mtx::Matrix< T >::mult_col_by_another (
            unsigned to,
            unsigned from )
```

Column multiplication.

Multiply values of each element in column *to* by the elements of column *from*. The elements in column *from* are unchanged.

Exceptions

std::out_of_range	when column index is out of range

5.6.3.21 mult_hadamard()

```
template<typename T >
Matrix< T > & Mtx::Matrix< T >::mult_hadamard (
            const Matrix< T > & m )
```

Matrix Hadamard product (in-place).

Calculates a Hadamard product of two matrices $A \otimes B$. A and B must be the same size. Hadamard product is calculated as an element-wise multiplication between the matrices. Operation is performed in-place by modifying elements of the matrix.

Exceptions

std::runtime_error	when matrix dimensions do not match

References Mtx::Matrix< T >::cols(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::operator^=().

5.6.3.22 mult_row_by_another()

```
template<typename T >
void Mtx::Matrix< T >::mult_row_by_another (
            unsigned to,
            unsigned from )
```

Row multiplication.

Multiply values of each element in row *to* by the elements of row *from*. The elements in row *from* are unchanged.

Exceptions

std::out_of_range	when row index is out of range

5.6.3.23 numel()

```
template<typename T >
unsigned Mtx::Matrix< T >::numel ( ) const [inline]
```

Matrix capacity.

Returns the number of the elements stored within the matrix, i.e. a product of both dimensions.

Referenced by Mtx::add(), Mtx::div(), Mtx::foreach_elem(), Mtx::householder_reflection(), Mtx::inv(), Mtx::Matrix< T >::isequal(), Mtx::lu(), Mtx::lup(), Mtx::make_complex(), Mtx::make_complex(), Mtx::Matrix< T >::Matrix(), Mtx::Matrix< T >::Matrix(), Mtx::Matrix< T >::Matrix(), Mtx::Matrix< T >::Matrix(), Mtx::mult(), Mtx::norm_fro(), Mtx::solve_posdef(), Mtx::solve_square(), Mtx::solve_tril(), Mtx::solve_triu(), and Mtx::subtract().

5.6.3.24 operator std::vector< T >()

```
template<typename T >
Mtx::Matrix< T >::operator std::vector< T > ( ) const [inline], [explicit]
```

Vector cast operator.

Converts the matrix to a vector with *nrows* x *ncols* elements. Element order in the vector follow column-major format.

5.6.3.25 operator()() [1/2]

```
template<typename T >
T & Mtx::Matrix< T >::operator() (
            unsigned nel ) [inline]
```

Element access operator (1D)

Access specific matrix element using singular index of the element. Follows column-major convention.

Exceptions

std::out_of_range	when element index is out of range

5.6.3.26 operator()() [2/2]

```
template<typename T >
T & Mtx::Matrix< T >::operator() (
            unsigned row,
            unsigned col )  [inline]
```

Element access operator (2D)

Access specific matrix element using row and column index of the element.

Exceptions

std::out_of_range	when row or column index is out of range of matrix dimensions

5.6.3.27 operator=() [1/2]

```
template<typename T >
Matrix< T > & Mtx::Matrix< T >::operator= (
            const Matrix< T > & other )
```

Matrix assignment.

Performs deep-copy of another matrix.

5.6.3.28 operator=() [2/2]

```
template<typename T >
Matrix< T > & Mtx::Matrix< T >::operator= (
            T s )
```

Matrix fill operator.

Assigns value of each element in the matrix to a given scalar. This method does not affect the shape and capacity of the matrix.

5.6.3.29 ptr() [1/2]

```
template<typename T >
T * Mtx::Matrix< T >::ptr ( )  [inline]
```

Memory pointer.

Returns a pointer to the first element in the array used internally by the matrix. The matrix memory is arranged in a column-major order.

Exceptions

std::out_of_range	when row or column index is out of range

5.6.3.30 ptr() [2/2]

```
template<typename T >
T * Mtx::Matrix< T >::ptr (
            unsigned row,
            unsigned col )  [inline]
```

Memory pointer.

Returns a pointer to the selected element in the array used internally by the matrix. The matrix memory is arranged in a column-major order.

5.6.3.31 reshape()

```
template<typename T >
void Mtx::Matrix< T >::reshape (
            unsigned rows,
            unsigned cols )
```

Matrix dimension reshape.

Modifies the first and the second dimension of the matrix according to the input parameters. A number of elements in the reshaped matrix must be the preserved and not changed comparing to the state before the reshape.

Exceptions

std::runtime_error	when reshape attempts to change the number of elements

5.6.3.32 resize()

```
template<typename T >
void Mtx::Matrix< T >::resize (
            unsigned rows,
            unsigned cols )
```

Resize the matrix.

Clears the content of the matrix and changes it dimensions to be equal to the specified number of rows and columns. Remark that the content of the matrix is lost after calling the reshape method.

Referenced by Mtx::Matrix< T >::clear().

5.6.3.33 row_from_vector()

```
template<typename T >
void Mtx::Matrix< T >::row_from_vector (
            const std::vector< T > & vec,
            unsigned row ) [inline]
```

Row from vector.

Assigns values of elements of a row *col* to the values stored in the input vector. Size of the vector must be equal to the number of columns of the matrix.

Exceptions

std::runtime_error	when std::vector size is not equal to number of columnc
std::out_of_range	when row index out of range

5.6.3.34 row_to_vector()

```
template<typename T >
std::vector< T > Mtx::Matrix< T >::row_to_vector (
            unsigned row ) const [inline]
```

Row to vector.

Stores elements from row *row* to a std::vector.

Exceptions

std::out_of_range	when row index is out of range

5.6.3.35 rows()

```
template<typename T >
unsigned Mtx::Matrix< T >::rows ( ) const [inline]
```

Number of rows.

Returns the number of rows of the matrix, i.e. the value of the first dimension.

Referenced by Mtx::Matrix< T >::add(), Mtx::add(), Mtx::add(), Mtx::adj(), Mtx::chol(), Mtx::cholinv(), Mtx::circshift(), Mtx::cofactor(), Mtx::det(), Mtx::diag(), Mtx::div(), Mtx::eigenvalues(), Mtx::hessenberg(), Mtx::inv(), Mtx::inv_gauss_jordan(), Mtx::inv_tril(), Mtx::inv_triu(), Mtx::Matrix< T >::isequal(), Mtx::Matrix< T >::isequal(), Mtx::ishess(), Mtx::istril(), Mtx::istriu(), Mtx::kron(), Mtx::ldl(), Mtx::lu(), Mtx::lup(), Mtx::make_complex(), Mtx::make_complex(), Mtx::mult(), Mtx::mult(), Mtx::mult(), Mtx::mult(), Mtx::Matrix< T >::mult_hadamard(), Mtx::mult_hadamard(), Mtx::operator<<(), Mtx::permute_cols(), Mtx::permute_rows(), Mtx::pinv(), Mtx::qr_householder(), Mtx::qr_red_gs(), Mtx::repmat(), Mtx::Matrix< T >::set_submatrix(), Mtx::solve_posdef(), Mtx::solve_square(), Mtx::solve_tril(), Mtx::solve_triu(), Mtx::Matrix< T >::subtract(), Mtx::subtract(), Mtx::subtract(), Mtx::trace(), Mtx::tril(), and Mtx::triu().

5.6.3.36 set_submatrix()

```
template<typename T >
void Mtx::Matrix< T >::set_submatrix (
            const Matrix< T > & smtx,
            unsigned row_first,
            unsigned col_first )
```

Embed a submatrix.

Embed elements of the input submatrix at the specified range of row and column indices. The elements of input submatrix are placed starting at row index incated by *row_first* and column indices *col_first*.

Exceptions

std::out_of_range	when row or column index is out of range of matrix dimensions
std::runtime_error	when input matrix is empty (i.e., it has zero elements)

References Mtx::Matrix< T >::cols(), and Mtx::Matrix< T >::rows().

5.6.3.37 subtract() [1/2]

```
template<typename T >
Matrix< T > & Mtx::Matrix< T >::subtract (
            const Matrix< T > & m )
```

Matrix subtraction (in-place).

Calculates a subtraction of two matrices $A - B$. A and B must be the same size. Operation is performed in-place by modifying elements of the matrix.

Exceptions

std::runtime_error	when matrix dimensions do not match

References Mtx::Matrix< T >::cols(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::operator-=(), and Mtx::operator-=().

5.6.3.38 subtract() [2/2]

```
template<typename T >
Matrix< T > & Mtx::Matrix< T >::subtract (
            T s )
```

Matrix subtraction with scalar (in-place).

Subtracts a scalar s from each element of the matrix. Operation is performed in-place by modifying elements of the matrix.

5.6.3.39 swap_cols()

```
template<typename T >
void Mtx::Matrix< T >::swap_cols (
            unsigned i,
            unsigned j )
```

Column swap.

Swaps element values between two columns.

Exceptions

std::out_of_range	when column index is out of range

5.6.3.40 swap_rows()

```
template<typename T >
void Mtx::Matrix< T >::swap_rows (
            unsigned i,
            unsigned j )
```

Row swap.

Swaps element values of two columns.

Exceptions

std::out_of_range	when row index is out of range

5.6.3.41 transpose()

```
template<typename T >
Matrix< T > Mtx::Matrix< T >::transpose ( ) const  [inline]
```

Transpose a matrix.

Returns a matrix that is a transposition of an input matrix.

Referenced by Mtx::transpose().

The documentation for this class was generated from the following file:

- matrix.hpp

5.7 Mtx::QR_result< T > Struct Template Reference

Result of QR decomposition.

```
#include <matrix.hpp>
```

Public Attributes

- Matrix< T > **Q**

  Orthogonal matrix.
- Matrix< T > **R**

  Upper triangular matrix.

5.7.1 Detailed Description

template<typename T>
struct Mtx::QR_result< T >

Result of QR decomposition.

This structure stores the result of QR decomposition, returned by, e.g., from qr() function. Note that the dimensions of Q and R matrices depends on the employed variant of QR decomposition.

The documentation for this struct was generated from the following file:

- matrix.hpp

5.8 Mtx::singular_matrix_exception Class Reference

Singular matrix exception.

`#include <matrix.hpp>`

Inheritance diagram for Mtx::singular_matrix_exception:

Chapter 6

File Documentation

6.1 examples.cpp File Reference

6.1.1 Detailed Description

Provides various examples of matrix.hpp library usage.

6.2 matrix.hpp File Reference

Classes

- class Mtx::singular_matrix_exception

    Singular matrix exception.
- struct Mtx::LU_result< T >

    Result of LU decomposition.
- struct Mtx::LUP_result< T >

    Result of LU decomposition with pivoting.
- struct Mtx::QR_result< T >

    Result of QR decomposition.
- struct Mtx::Hessenberg_result< T >

    Result of Hessenberg decomposition.
- struct Mtx::LDL_result< T >

    Result of LDL decomposition.
- struct Mtx::Eigenvalues_result< T >

    Result of eigenvalues.
- class Mtx::Matrix< T >

Functions

- template< typename T , typename std::enable_if<!is_complex< T >::value, int >::type = 0>
  T Mtx::cconj (T x)

  Complex conjugate helper.
- template< typename T , typename std::enable_if<!is_complex< T >::value, int >::type = 0>
  T Mtx::csign (T x)

  Complex sign helper.
- template< typename T >
  Matrix< T > Mtx::zeros (unsigned nrows, unsigned ncols)

  Matrix of zeros.
- template< typename T >
  Matrix< T > Mtx::zeros (unsigned n)

  Square matrix of zeros.
- template< typename T >
  Matrix< T > Mtx::ones (unsigned nrows, unsigned ncols)

  Matrix of ones.
- template< typename T >
  Matrix< T > Mtx::ones (unsigned n)

  Square matrix of ones.
- template< typename T >
  Matrix< T > Mtx::eye (unsigned n)

  Identity matrix.
- template< typename T >
  Matrix< T > Mtx::diag (const T *array, size_t n)

  Diagonal matrix from array.
- template< typename T >
  Matrix< T > Mtx::diag (const std::vector< T > &v)

  Diagonal matrix from std::vector.
- template< typename T >
  std::vector< T > Mtx::diag (const Matrix< T > &A)

  Diagonal extraction.
- template< typename T >
  Matrix< T > Mtx::circulant (const T *array, unsigned n)

  Circulant matrix from array.
- template< typename T >
  Matrix< std::complex< T > > Mtx::make_complex (const Matrix< T > &Re, const Matrix< T > &Im)

  Create complex matrix from real and imaginary matrices.
- template< typename T >
  Matrix< std::complex< T > > Mtx::make_complex (const Matrix< T > &Re)

  Create complex matrix from real matrix.
- template< typename T >
  Matrix< T > Mtx::real (const Matrix< std::complex< T > > &C)

  Get real part of complex matrix.
- template< typename T >
  Matrix< T > Mtx::imag (const Matrix< std::complex< T > > &C)

  Get imaginary part of complex matrix.
- template< typename T >
  Matrix< T > Mtx::circulant (const std::vector< T > &v)

  Circulant matrix from std::vector.
- template< typename T >
  Matrix< T > Mtx::transpose (const Matrix< T > &A)

  Transpose a matrix.

- template<typename T >
  Matrix< T > Mtx::ctranspose (const Matrix< T > &A)

  Transpose a complex matrix.
- template<typename T >
  Matrix< T > Mtx::circshift (const Matrix< T > &A, int row_shift, int col_shift)

  Circular shift.
- template<typename T >
  Matrix< T > Mtx::repmat (const Matrix< T > &A, unsigned m, unsigned n)

  Repeat matrix.
- template<typename T >
  double Mtx::norm_fro (const Matrix< T > &A)

  Frobenius norm.
- template<typename T >
  double Mtx::norm_fro (const Matrix< std::complex< T > > &A)

  Frobenius norm of complex matrix.
- template<typename T >
  Matrix< T > Mtx::tril (const Matrix< T > &A)

  Extract triangular lower part.
- template<typename T >
  Matrix< T > Mtx::triu (const Matrix< T > &A)

  Extract triangular upper part.
- template<typename T >
  bool Mtx::istril (const Matrix< T > &A)

  Lower triangular matrix check.
- template<typename T >
  bool Mtx::istriu (const Matrix< T > &A)

  Lower triangular matrix check.
- template<typename T >
  bool Mtx::ishess (const Matrix< T > &A)

  Hessenberg matrix check.
- template<typename T >
  void Mtx::foreach_elem (Matrix< T > &A, std::function< T(T)> func)

  Applies custom function element-wise in-place.
- template<typename T >
  Matrix< T > Mtx::foreach_elem_copy (const Matrix< T > &A, std::function< T(T)> func)

  Applies custom function element-wise with matrix copy.
- template<typename T >
  Matrix< T > Mtx::permute_rows (const Matrix< T > &A, const std::vector< unsigned > perm)

  Permute rows of the matrix.
- template<typename T >
  Matrix< T > Mtx::permute_cols (const Matrix< T > &A, const std::vector< unsigned > perm)

  Permute columns of the matrix.
- template<typename T , bool transpose_first = false, bool transpose_second = false>
  Matrix< T > Mtx::mult (const Matrix< T > &A, const Matrix< T > &B)

  Matrix multiplication.
- template<typename T , bool transpose_first = false, bool transpose_second = false>
  Matrix< T > Mtx::mult_hadamard (const Matrix< T > &A, const Matrix< T > &B)

  Matrix Hadamard (elementwise) multiplication.
- template<typename T , bool transpose_first = false, bool transpose_second = false>
  Matrix< T > Mtx::add (const Matrix< T > &A, const Matrix< T > &B)

  Matrix addition.
- template<typename T , bool transpose_first = false, bool transpose_second = false>
  Matrix< T > Mtx::subtract (const Matrix< T > &A, const Matrix< T > &B)

Matrix subtraction.

- template< typename T >
  std::vector< T > Mtx::mult (const Matrix< T > &A, const std::vector< T > &v)

  Multiplication of matrix by std::vector.
- template< typename T >
  std::vector< T > Mtx::mult (const std::vector< T > &v, const Matrix< T > &A)

  Multiplication of std::vector by matrix.
- template< typename T >
  Matrix< T > Mtx::add (const Matrix< T > &A, T s)

  Addition of scalar to matrix.
- template< typename T >
  Matrix< T > Mtx::subtract (const Matrix< T > &A, T s)

  Subtraction of scalar from matrix.
- template< typename T >
  Matrix< T > Mtx::mult (const Matrix< T > &A, T s)

  Multiplication of matrix by scalar.
- template< typename T >
  Matrix< T > Mtx::div (const Matrix< T > &A, T s)

  Division of matrix by scalar.
- template< typename T >
  std::ostream & Mtx::operator<< (std::ostream &os, const Matrix< T > &A)

  Matrix ostream operator.
- template< typename T >
  Matrix< T > Mtx::operator+ (const Matrix< T > &A, const Matrix< T > &B)

  Matrix sum.
- template< typename T >
  Matrix< T > Mtx::operator- (const Matrix< T > &A, const Matrix< T > &B)

  Matrix subtraction.
- template< typename T >
  Matrix< T > Mtx::operator^ (const Matrix< T > &A, const Matrix< T > &B)

  Matrix Hadamard product.
- template< typename T >
  Matrix< T > Mtx::operator* (const Matrix< T > &A, const Matrix< T > &B)

  Matrix product.
- template< typename T >
  std::vector< T > Mtx::operator* (const Matrix< T > &A, const std::vector< T > &v)

  Matrix and std::vector product.
- template< typename T >
  Matrix< T > Mtx::operator+ (const Matrix< T > &A, T s)

  Matrix sum with scalar.
- template< typename T >
  Matrix< T > Mtx::operator- (const Matrix< T > &A, T s)

  Matrix subtraction with scalar.
- template< typename T >
  Matrix< T > Mtx::operator* (const Matrix< T > &A, T s)

  Matrix product with scalar.
- template< typename T >
  Matrix< T > Mtx::operator/ (const Matrix< T > &A, T s)

  Matrix division by scalar.
- template< typename T >
  Matrix< T > Mtx::operator+ (T s, const Matrix< T > &A)
- template< typename T >
  Matrix< T > Mtx::operator* (T s, const Matrix< T > &A)

Matrix product with scalar.

- template<typename T >
  Matrix< T > & Mtx::operator+= (Matrix< T > &A, const Matrix< T > &B)

  Matrix sum.
- template<typename T >
  Matrix< T > & Mtx::operator-= (Matrix< T > &A, const Matrix< T > &B)

  Matrix subtraction.
- template<typename T >
  Matrix< T > & Mtx::operator*= (Matrix< T > &A, const Matrix< T > &B)

  Matrix product.
- template<typename T >
  Matrix< T > & Mtx::operator^= (Matrix< T > &A, const Matrix< T > &B)

  Matrix Hadamard product.
- template<typename T >
  Matrix< T > & Mtx::operator+= (Matrix< T > &A, T s)

  Matrix sum with scalar.
- template<typename T >
  Matrix< T > & Mtx::operator-= (Matrix< T > &A, T s)

  Matrix subtraction with scalar.
- template<typename T >
  Matrix< T > & Mtx::operator*= (Matrix< T > &A, T s)

  Matrix product with scalar.
- template<typename T >
  Matrix< T > & Mtx::operator/= (Matrix< T > &A, T s)

  Matrix division by scalar.
- template<typename T >
  bool Mtx::operator== (const Matrix< T > &A, const Matrix< T > &b)

  Matrix equality check operator.
- template<typename T >
  bool Mtx::operator!= (const Matrix< T > &A, const Matrix< T > &b)

  Matrix non-equality check operator.
- template<typename T >
  Matrix< T > Mtx::kron (const Matrix< T > &A, const Matrix< T > &B)

  Kronecker product.
- template<typename T >
  Matrix< T > Mtx::adj (const Matrix< T > &A)

  Adjugate matrix.
- template<typename T >
  Matrix< T > Mtx::cofactor (const Matrix< T > &A, unsigned p, unsigned q)

  Cofactor matrix.
- template<typename T >
  T Mtx::det_lu (const Matrix< T > &A)

  Matrix determinant from on LU decomposition.
- template<typename T >
  T Mtx::det (const Matrix< T > &A)

  Matrix determinant.
- template<typename T >
  LU_result< T > Mtx::lu (const Matrix< T > &A)

  LU decomposition.
- template<typename T >
  LUP_result< T > Mtx::lup (const Matrix< T > &A)

  LU decomposition with pivoting.

- template<typename T >
  Matrix< T > Mtx::inv_gauss_jordan (const Matrix< T > &A)

  Matrix inverse using Gauss-Jordan elimination.
- template<typename T >
  Matrix< T > Mtx::inv_tril (const Matrix< T > &A)

  Matrix inverse for lower triangular matrix.
- template<typename T >
  Matrix< T > Mtx::inv_triu (const Matrix< T > &A)

  Matrix inverse for upper triangular matrix.
- template<typename T >
  Matrix< T > Mtx::inv_posdef (const Matrix< T > &A)

  Matrix inverse for Hermitian positive-definite matrix.
- template<typename T >
  Matrix< T > Mtx::inv_square (const Matrix< T > &A)

  Matrix inverse for general square matrix.
- template<typename T >
  Matrix< T > Mtx::inv (const Matrix< T > &A)

  Matrix inverse (universal).
- template<typename T >
  Matrix< T > Mtx::pinv (const Matrix< T > &A)

  Moore-Penrose pseudoinverse.
- template<typename T >
  T Mtx::trace (const Matrix< T > &A)

  Matrix trace.
- template<typename T >
  double Mtx::cond (const Matrix< T > &A)

  Condition number of a matrix.
- template<typename T >
  Matrix< T > Mtx::chol (const Matrix< T > &A)

  Cholesky decomposition.
- template<typename T >
  Matrix< T > Mtx::cholinv (const Matrix< T > &A)

  Inverse of Cholesky decomposition.
- template<typename T >
  LDL_result< T > Mtx::ldl (const Matrix< T > &A)

  LDL decomposition.
- template<typename T >
  QR_result< T > Mtx::qr_red_gs (const Matrix< T > &A)

  Reduced QR decomposition based on Gram-Schmidt method.
- template<typename T >
  Matrix< T > Mtx::householder_reflection (const Matrix< T > &a)

  Generate Householder reflection.
- template<typename T >
  QR_result< T > Mtx::qr_householder (const Matrix< T > &A, bool calculate_Q=true)

  QR decomposition based on Householder method.
- template<typename T >
  QR_result< T > Mtx::qr (const Matrix< T > &A, bool calculate_Q=true)

  QR decomposition.
- template<typename T >
  Hessenberg_result< T > Mtx::hessenberg (const Matrix< T > &A, bool calculate_Q=true)

  Hessenberg decomposition.
- template<typename T >
  std::complex< T > Mtx::wilkinson_shift (const Matrix< std::complex< T > > &H, T tol=1e-10)

Wilkinson's shift for complex eigenvalues.

- template<typename T >
  Eigenvalues_result< T > Mtx::eigenvalues (const Matrix< std::complex< T > > &A, T tol=1e-12, unsigned max_iter=100)

  Matrix eigenvalues of complex matrix.
- template<typename T >
  Eigenvalues_result< T > Mtx::eigenvalues (const Matrix< T > &A, T tol=1e-12, unsigned max_iter=100)

  Matrix eigenvalues of real matrix.
- template<typename T >
  Matrix< T > Mtx::solve_triu (const Matrix< T > &U, const Matrix< T > &B)

  Solves the upper triangular system.
- template<typename T >
  Matrix< T > Mtx::solve_tril (const Matrix< T > &L, const Matrix< T > &B)

  Solves the lower triangular system.
- template<typename T >
  Matrix< T > Mtx::solve_square (const Matrix< T > &A, const Matrix< T > &B)

  Solves the square system.
- template<typename T >
  Matrix< T > Mtx::solve_posdef (const Matrix< T > &A, const Matrix< T > &B)

  Solves the positive definite (Hermitian) system.

6.2.1 Function Documentation

6.2.1.1 add() [1/2]

```
template<typename T , bool transpose_first = false, bool transpose_second = false>
Matrix< T > Mtx::add (
            const Matrix< T > & A,
            const Matrix< T > & B )
```

Matrix addition.

Performs addition of two matrices.

This function supports template parameterization of input matrix transposition, providing better efficiency than in case of using ctranspose() function due to zero-copy operation. In case of complex matrices, conjugate (Hermitian) transpose is used.

Template Parameters

transpose_first	if set to true, the left-side input matrix will be transposed during operation
transpose_second	if set to true, the right-side input matrix will be transposed during operation

Parameters

A	left-side matrix of size N x M (after transposition)
B	right-side matrix of size N x M (after transposition)

Returns

output matrix of size N x M

References Mtx::add(), Mtx::cconj(), Mtx::Matrix< T >::cols(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::add(), Mtx::add(), Mtx::operator+(), Mtx::operator+(), and Mtx::operator+().

6.2.1.2 add() [2/2]

```
template<typename T >
Matrix< T > Mtx::add (
            const Matrix< T > & A,
            T s )
```

Addition of scalar to matrix.

Adds a scalar s from each element of the input matrix. This method does not modify the input matrix but creates a copy.

References Mtx::add(), Mtx::Matrix< T >::cols(), Mtx::Matrix< T >::numel(), and Mtx::Matrix< T >::rows().

6.2.1.3 adj()

```
template<typename T >
Matrix< T > Mtx::adj (
            const Matrix< T > & A )
```

Adjugate matrix.

Calculates adjugate of the matrix being the transpose of its cofactor matrix.
More information: https://en.wikipedia.org/wiki/Adjugate_matrix

Exceptions

std::runtime_error	when the input matrix is not square

References Mtx::adj(), Mtx::cofactor(), Mtx::Matrix< T >::cols(), Mtx::det(), Mtx::Matrix< T >::issquare(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::adj().

6.2.1.4 cconj()

```
template<typename T , typename std::enable_if<!is_complex< T >::value, int >::type = 0>
T Mtx::cconj (
            T x )  [inline]
```

Complex conjugate helper.

Helper function to allow for generalization of code for complex and real types.
For real numbers, this function returns the input argument unchanged.
For complex numbers, this function calls std::conj.

References Mtx::cconj().

Referenced by Mtx::add(), Mtx::cconj(), Mtx::chol(), Mtx::cholinv(), Mtx::Matrix< T >::ctranspose(), Mtx::ldl(), Mtx::mult(), Mtx::mult_hadamard(), Mtx::qr_red_gs(), and Mtx::subtract().

6.2.1.5 chol()

```
template<typename T >
Matrix< T > Mtx::chol (
            const Matrix< T > & A )
```

Cholesky decomposition.

The Cholesky decomposition of a Hermitian positive-definite matrix A, is a decomposition of the form:
$A = LL^H$
where L is a lower triangular matrix with real and positive diagonal entries, and L^H denotes the conjugate transpose of L.
Input matrix must be square. If the matrix is not Hermitian positive-definite or is ill-conditioned, the result may be unreliable.
More information: https://en.wikipedia.org/wiki/Cholesky_decomposition

Exceptions

std::runtime_error	when the input matrix is not square
singular_matrix_exception	when the input matrix is singular (detected as division by 0 during computation)

References Mtx::cconj(), Mtx::chol(), Mtx::Matrix< T >::issquare(), Mtx::Matrix< T >::rows(), and Mtx::tril().

Referenced by Mtx::chol(), and Mtx::solve_posdef().

6.2.1.6 cholinv()

```
template<typename T >
Matrix< T > Mtx::cholinv (
            const Matrix< T > & A )
```

Inverse of Cholesky decomposition.

This function directly calculates the inverse of Cholesky decomposition L^{-1} such that $A = LL^H$.
See chol() for reference on Cholesky decomposition.
Input matrix must be square. If the matrix is not Hermitian positive-definite or is ill-conditioned, the result may be unreliable.
More information: https://en.wikipedia.org/wiki/Cholesky_decomposition

Exceptions

std::runtime_error	when the input matrix is not square
singular_matrix_exception	when the input matrix is singular (detected as division by 0 during computation)

References Mtx::cconj(), Mtx::cholinv(), Mtx::Matrix< T >::issquare(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::cholinv(), and Mtx::inv_posdef().

6.2.1.7 circshift()

```
template<typename T >
Matrix< T > Mtx::circshift (
            const Matrix< T > & A,
            int row_shift,
            int col_shift )
```

Circular shift.

Returns a matrix that is created by shifting the columns and rows of an input matrix in a circular manner.
If the specified shift factor is a positive value, columns of the matrix are shifted towards right or rows are shifted towards bottom. A negative value may be used to apply shifts in opposite directions.

Parameters

A	matrix
row_shift	row shift factor
col_shift	column shift factor

Returns

matrix inverse

References Mtx::circshift(), Mtx::Matrix< T >::cols(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::circshift().

6.2.1.8 circulant() [1/2]

```
template<typename T >
Matrix< T > Mtx::circulant (
            const std::vector< T > & v )  [inline]
```

Circulant matrix from std::vector.

Constructs a circulant matrix, whose the elements of the first column are set to the elements stored in the std::vector *v*. Size of the matrix is equal to the vector size.

Parameters

v	vector with data

Returns

circulant matrix

References Mtx::circulant().

6.2.1.9 circulant() [2/2]

```
template<typename T >
Matrix< T > Mtx::circulant (
            const T * array,
            unsigned n )
```

Circulant matrix from array.

Constructs a circulant matrix of size *n* x *n* by taking the elements from *array* as the first column.

Parameters

array	pointer to the first element of the array where the elements of the first column are stored
n	size of the matrix to be constructed. Also, a number of elements stored in *array*

Returns

circulant matrix

References Mtx::circulant().

Referenced by Mtx::circulant(), and Mtx::circulant().

6.2.1.10 cofactor()

```
template<typename T >
Matrix< T > Mtx::cofactor (
            const Matrix< T > & A,
            unsigned p,
            unsigned q )
```

Cofactor matrix.

Calculates first minor of the matrix by deleting row *p* and column *q*. Note that this function does not include sign change required by cofactor calculation.
More information: https://en.wikipedia.org/wiki/Cofactor_(linear_algebra)

Parameters

A	input square matrix
p	row to be deleted in the output matrix
q	column to be deleted in the output matrix

Exceptions

std::runtime_error	when the input matrix is not square
std::out_of_range	when row index *p* or column index \q are out of range
std::runtime_error	when input matrix *A* has less than 2 rows

References Mtx::cofactor(), Mtx::Matrix< T >::cols(), Mtx::Matrix< T >::issquare(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::adj(), and Mtx::cofactor().

6.2.1.11 cond()

```
template<typename T >
double Mtx::cond (
            const Matrix< T > & A )
```

Condition number of a matrix.

Calculates condition number of a matrix. The condition number of a matrix measures the sensitivity of a system solution of linear equations to errors in the data. The condition number is calculated by:
$\mathrm{cond} = \mathrm{norm}(A) * \mathrm{norm}(A^{-1})$
Frobenius norm is used for the sake of calculations.

References Mtx::cond(), Mtx::inv(), and Mtx::norm_fro().

Referenced by Mtx::cond().

6.2.1.12 csign()

```
template<typename T , typename std::enable_if<!is_complex< T >::value, int >::type = 0>
T Mtx::csign (
            T x ) [inline]
```

Complex sign helper.

Helper function to allow for generalization of code for complex and real types.
For real numbers, this function returns sign bit, i.e., 1 when the value is non-negative and -1 otherwise.
For complex numbers, this function calculates $e^{i \cdot arg(x)}$.

References Mtx::csign().

Referenced by Mtx::csign(), and Mtx::householder_reflection().

6.2.1.13 ctranspose()

```
template<typename T >
Matrix< T > Mtx::ctranspose (
            const Matrix< T > & A ) [inline]
```

Transpose a complex matrix.

Returns a matrix that is a conjugate (Hermitian) transposition of an input matrix.
Conjugate transpose applies a conjugate operation to all elements in addition to matrix transposition.

References Mtx::Matrix< T >::ctranspose(), and Mtx::ctranspose().

Referenced by Mtx::ctranspose().

6.2.1.14 det()

```
template<typename T >
T Mtx::det (
            const Matrix< T > & A )
```

Matrix determinant.

Calculates determinant of a square matrix. If the size of the matrix is smaller than 4, the determinant is calculated using hard-coded formulas. For matrix sizes equal to 4 and more, determinant is calculated recursively using Laplace expansion.
More information: https://en.wikipedia.org/wiki/Determinant

Exceptions

std::runtime_error	when the input matrix is not square

References Mtx::det(), Mtx::det_lu(), Mtx::Matrix< T >::issquare(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::adj(), Mtx::det(), and Mtx::inv().

6.2.1.15 det_lu()

```
template<typename T >
T Mtx::det_lu (
            const Matrix< T > & A )
```

Matrix determinant from on LU decomposition.

Calculates the determinant of a matrix using LU decomposition with pivoting.
Note that determinant is calculated as a product: $det(L) \cdot det(U) \cdot det(P)$, where determinants of *L* and *U* are calculated as the product of their diagonal elements, when the determinant of P is either 1 or -1 depending on the number of row swaps performed during the pivoting process.
More information: https://en.wikipedia.org/wiki/Determinant

Exceptions

std::runtime_error	when the input matrix is not square

References Mtx::det_lu(), Mtx::Matrix< T >::issquare(), and Mtx::lup().

Referenced by Mtx::det(), and Mtx::det_lu().

6.2.1.16 diag() [1/3]

```
template<typename T >
std::vector< T > Mtx::diag (
            const Matrix< T > & A )
```

Diagonal extraction.

Store diagonal elements of a square matrix in std::vector.

Parameters

A	square matrix

Returns

vector of diagonal elements

Exceptions

std::runtime_error	when the input matrix is not square

References Mtx::diag(), Mtx::Matrix< T >::issquare(), and Mtx::Matrix< T >::rows().

6.2.1.17 diag() [2/3]

```
template<typename T >
Matrix< T > Mtx::diag (
            const std::vector< T > & v )  [inline]
```

Diagonal matrix from std::vector.

Constructs a diagonal matrix, whose diagonal elements are set to the elements stored in the std::vector *v*. Size of the matrix is equal to the vector size.

Parameters

v	vector of diagonal elements

Returns

diagonal matrix

References Mtx::diag().

6.2.1.18 diag() [3/3]

```
template<typename T >
Matrix< T > Mtx::diag (
            const T * array,
            size_t n )
```

Diagonal matrix from array.

Constructs a diagonal matrix of size *n* x *n*, whose diagonal elements are set to the elements stored in the *array*.

Parameters

array	pointer to the first element of the array where the diagonal elements are stored
n	size of the matrix to be constructed. Also, a number of elements stored in *array*

Returns

diagonal matrix

References Mtx::diag().

Referenced by Mtx::diag(), Mtx::diag(), Mtx::diag(), and Mtx::eigenvalues().

6.2.1.19 div()

```
template<typename T >
Matrix< T > Mtx::div (
            const Matrix< T > & A,
            T s )
```

Division of matrix by scalar.

Divides each element of the input matrix by a scalar s. This method does not modify the input matrix but creates a copy.

References Mtx::Matrix< T >::cols(), Mtx::div(), Mtx::Matrix< T >::numel(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::div(), and Mtx::operator/().

6.2.1.20 eigenvalues() [1/2]

```
template<typename T >
Eigenvalues_result< T > Mtx::eigenvalues (
            const Matrix< std::complex< T > > & A,
            T tol = 1e-12,
            unsigned max_iter = 100 )
```

Matrix eigenvalues of complex matrix.

Computes eigenvalues of input square matrix using the QR method with shifts.

Parameters

A	input complex matrix to be decomposed
tol	numerical precision tolerance for stop condition
max_iter	maximum number of iterations

Returns

structure containing the result and status of eigenvalue calculation

Exceptions

std::runtime_error	when the input matrix is not square

References Mtx::Eigenvalues_result< T >::converged, Mtx::diag(), Mtx::Eigenvalues_result< T >::eig, Mtx::eigenvalues(), Mtx::Eigenvalues_result< T >::err, Mtx::hessenberg(), Mtx::Matrix< T >::issquare(), Mtx::QR_result< T >::Q, Mtx::qr(), Mtx::QR_result< T >::R, Mtx::Matrix< T >::rows(), and Mtx::wilkinson_shift().

Referenced by Mtx::eigenvalues(), and Mtx::eigenvalues().

6.2.1.21 eigenvalues() [2/2]

```
template<typename T >
Eigenvalues_result< T > Mtx::eigenvalues (
```

```
            const Matrix< T > & A,
            T tol = 1e-12,
            unsigned max_iter = 100 )
```

Matrix eigenvalues of real matrix.

Computes eigenvalues of input square matrix using the QR method with shifts.

Parameters

A	input real matrix to be decomposed
tol	numerical precision tolerance for stop condition
max_iter	maximum number of iterations

Returns

structure containing the result and status of eigenvalue calculation

References Mtx::eigenvalues(), and Mtx::make_complex().

6.2.1.22 eye()

```
template<typename T >
Matrix< T > Mtx::eye (
            unsigned n )
```

Identity matrix.

Construct a square identity matrix. In case of complex datatype, the diagonal elements are set to $1 + 0i$.

Parameters

n	size of the square matrix (the first and the second dimension)

Returns

zeros matrix

References Mtx::eye().

Referenced by Mtx::eye().

6.2.1.23 foreach_elem()

```
template<typename T >
void Mtx::foreach_elem (
            Matrix< T > & A,
            std::function< T(T)> func ) [inline]
```

Applies custom function element-wise in-place.

Applies specified function *func* to all elements of the input matrix.
This function applies operation to the elements in-place (zero-copy). In order to apply the function to the copy of the matrix without modifying the input one, use foreach_elem_copy().

Parameters

A	input matrix to be modified
func	function to be applied element-wise to A. It inputs one variable of template type T and returns variable of the same type.

References Mtx::foreach_elem(), and Mtx::Matrix< T >::numel().

Referenced by Mtx::foreach_elem(), and Mtx::foreach_elem_copy().

6.2.1.24 foreach_elem_copy()

```
template<typename T >
Matrix< T > Mtx::foreach_elem_copy (
            const Matrix< T > & A,
            std::function< T(T)> func )  [inline]
```

Applies custom function element-wise with matrix copy.

Applies the specified function *func* to all elements of the input matrix.
This function applies operation to the copy of the input matrix. For in-place (zero-copy) operation, use foreach_↩ elem().

Parameters

A	input matrix
func	function to be applied element-wise to A. It inputs one variable of template type T and returns variable of the same type

Returns

output matrix whose elements were modified by the function *func*

References Mtx::foreach_elem(), and Mtx::foreach_elem_copy().

Referenced by Mtx::foreach_elem_copy().

6.2.1.25 hessenberg()

```
template<typename T >
Hessenberg_result< T > Mtx::hessenberg (
            const Matrix< T > & A,
            bool calculate_Q = true )
```

Hessenberg decomposition.

Finds the Hessenberg decomposition of $A = QHQ^*$. Hessenberg matrix H has zero entries below the first subdiagonal. More information: https://en.wikipedia.org/wiki/Hessenberg_matrix

Parameters

A	input matrix to be decomposed
calculate↩_Q	indicates if *Q* to be calculated

Returns

structure encapsulating calculated *H* and *Q*. *Q* is calculated only when *calculate_Q* = True.

Exceptions

std::runtime_error	when the input matrix is not square

References Mtx::Hessenberg_result< T >::H, Mtx::hessenberg(), Mtx::householder_reflection(), Mtx::Matrix< T >::issquare(), Mtx::Hessenberg_result< T >::Q, and Mtx::Matrix< T >::rows().

Referenced by Mtx::eigenvalues(), and Mtx::hessenberg().

6.2.1.26 householder_reflection()

```
template<typename T >
Matrix< T > Mtx::householder_reflection (
            const Matrix< T > & a )
```

Generate Householder reflection.

Generates Householder reflection for a given vector. The function returns vector *v* normalized to square root of 2.

Parameters

a	column vector of size *N* x *1*

Returns

column vector with Householder reflection of *a*

References Mtx::Matrix< T >::cols(), Mtx::csign(), Mtx::householder_reflection(), Mtx::norm_fro(), and Mtx::Matrix< T >::numel().

Referenced by Mtx::hessenberg(), Mtx::householder_reflection(), and Mtx::qr_householder().

6.2.1.27 imag()

```
template<typename T >
Matrix< T > Mtx::imag (
            const Matrix< std::complex< T > > & C )
```

Get imaginary part of complex matrix.

Constructs a matrix of real type from std::complex matrix by taking its imaginary part.

References Mtx::imag().

Referenced by Mtx::imag().

6.2.1.28 inv()

```
template<typename T >
Matrix< T > Mtx::inv (
            const Matrix< T > & A )
```

Matrix inverse (universal).

Calculates an inverse of a square matrix. If the size of the matrix is smaller than 4, inverse is calculated using hard-coded formulas. For matrix sizes equal to 4 and more, determinant is calculated recursively using Gauss-Jordan elimination.
If the inverse doesn't exists, e.g., because the input matrix was singular, an empty matrix is returned.
More information: https://en.wikipedia.org/wiki/Gaussian_elimination

Exceptions

std::runtime_error	when the input matrix is not square
singular_matrix_exception	when the input matrix is singular (detected as division by 0 during computation)

References Mtx::det(), Mtx::inv(), Mtx::inv_square(), Mtx::Matrix< T >::issquare(), Mtx::Matrix< T >::numel(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::cond(), and Mtx::inv().

6.2.1.29 inv_gauss_jordan()

```
template<typename T >
Matrix< T > Mtx::inv_gauss_jordan (
            const Matrix< T > & A )
```

Matrix inverse using Gauss-Jordan elimination.

Calculates an inverse of a square matrix recursively using Gauss-Jordan elimination.
If the inverse doesn't exists, e.g., because the input matrix was singular, an empty matrix is returned.
More information: https://en.wikipedia.org/wiki/Gaussian_elimination
Using inv() function instead of this one offers better performance for matrices of size smaller than 4.

Exceptions

std::runtime_error	when the input matrix is not square
singular_matrix_exception	when input matrix is singular

References Mtx::inv_gauss_jordan(), Mtx::Matrix< T >::issquare(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::inv_gauss_jordan().

6.2.1.30 inv_posdef()

```
template<typename T >
Matrix< T > Mtx::inv_posdef (
            const Matrix< T > & A )
```

Matrix inverse for Hermitian positive-definite matrix.

Calculates an inverse of symmetric (for real input) or Hermitian (for complex input) positive definite matrix using Cholesky decomposition.
This function provides more optimal performance than inv() for symmetric matrices. However, validation of input matrix structure is not performed. It is up to the user to decide when this function can be used and, if needed, perform required validations.
More information: https://en.wikipedia.org/wiki/Gaussian_elimination

Exceptions

std::runtime_error	when the input matrix is not square
singular_matrix_exception	when the input matrix is singular (detected as division by 0 during computation)

References Mtx::cholinv(), and Mtx::inv_posdef().

Referenced by Mtx::inv_posdef(), and Mtx::pinv().

6.2.1.31 inv_square()

```
template<typename T >
Matrix< T > Mtx::inv_square (
            const Matrix< T > & A )
```

Matrix inverse for general square matrix.

Calculates an inverse of square matrix using matrix.
This function provides more optimal performance than inv() for upper triangular matrices. However, validation of input matrix structure is not performed. It is up to the user to decide when this function can be used and, if needed, perform required validations.

Exceptions

std::runtime_error	when the input matrix is not square
singular_matrix_exception	when the input matrix is singular (detected as division by 0 during computation)

References Mtx::inv_square(), Mtx::inv_tril(), Mtx::inv_triu(), Mtx::Matrix< T >::issquare(), Mtx::lup(), and Mtx::permute_rows().

Referenced by Mtx::inv(), and Mtx::inv_square().

6.2.1.32 inv_tril()

```
template<typename T >
Matrix< T > Mtx::inv_tril (
            const Matrix< T > & A )
```

Matrix inverse for lower triangular matrix.

Calculates an inverse of lower triangular matrix.
This function provides more optimal performance than inv() for lower triangular matrices. However, validation of triangular input matrix structure is not performed. It is up to the user to decide when this function can be used and, if needed, perform required validations.

Exceptions

std::runtime_error	when the input matrix is not square
singular_matrix_exception	when the input matrix is singular (detected as division by 0 during computation)

References Mtx::inv_tril(), Mtx::Matrix< T >::issquare(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::inv_square(), and Mtx::inv_tril().

6.2.1.33 inv_triu()

```
template<typename T >
Matrix< T > Mtx::inv_triu (
            const Matrix< T > & A )
```

Matrix inverse for upper triangular matrix.

Calculates an inverse of upper triangular matrix.
This function provides more optimal performance than inv() for upper triangular matrices. However, validation of triangular input matrix structure is not performed. It is up to the user to decide when this function can be used and, if needed, perform required validations.

Exceptions

std::runtime_error	when the input matrix is not square
singular_matrix_exception	when the input matrix is singular (detected as division by 0 during computation)

References Mtx::inv_triu(), Mtx::Matrix< T >::issquare(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::inv_square(), and Mtx::inv_triu().

6.2.1.34 ishess()

```
template<typename T >
bool Mtx::ishess (
            const Matrix< T > & A )
```

Hessenberg matrix check.

Return true if A is a, upper Hessenberg matrix, i.e., it is square and has only zero entries below the first subdiagonal. This function uses hard decision for equality check.

References Mtx::ishess(), Mtx::Matrix< T >::issquare(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::ishess().

6.2.1.35 istril()

```
template<typename T >
bool Mtx::istril (
            const Matrix< T > & A )
```

Lower triangular matrix check.

Return true if A is a lower triangular matrix, i.e., when it has nonzero entries only on the main diagonal and below. This function uses hard decision for equality check.

References Mtx::Matrix< T >::cols(), Mtx::istril(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::istril().

6.2.1.36 istriu()

```
template<typename T >
bool Mtx::istriu (
            const Matrix< T > & A )
```

Lower triangular matrix check.

Return true if A is a lower triangular matrix, i.e., when it has nonzero entries only on the main diagonal and below. This function uses hard decision for equality check.

References Mtx::Matrix< T >::cols(), Mtx::istriu(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::istriu().

6.2.1.37 kron()

```
template<typename T >
Matrix< T > Mtx::kron (
            const Matrix< T > & A,
            const Matrix< T > & B )
```

Kronecker product.

Form the Kronecker product of two matrices. Kronecker product is defined block by block as $C = [A(i,j) \cdot B]$.
More information: https://en.wikipedia.org/wiki/Kronecker_product

References Mtx::Matrix< T >::cols(), Mtx::kron(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::kron().

6.2.1.38 ldl()

```
template<typename T >
LDL_result< T > Mtx::ldl (
            const Matrix< T > & A )
```

LDL decomposition.

The LDL decomposition of a Hermitian positive-definite matrix A, is a decomposition of the form:
$A = LDL^H$
where L is a lower unit triangular matrix with ones at the diagonal, L^H denotes the conjugate transpose of L, and D denotes diagonal matrix.
Input matrix must be square. If the matrix is not Hermitian positive-definite or is ill-conditioned, the result may be unreliable.
More information: https://en.wikipedia.org/wiki/Cholesky_decomposition#LDL_↩
decomposition

Parameters

A	input positive-definite matrix to be decomposed

Returns

structure encapsulating calculated *L* and *D*

Exceptions

std::runtime_error	when the input matrix is not square
singular_matrix_exception	when the input matrix is singular (detected as division by 0 during computation)

References Mtx::cconj(), Mtx::LDL_result< T >::d, Mtx::Matrix< T >::issquare(), Mtx::LDL_result< T >::L, Mtx::ldl(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::ldl().

6.2.1.39 lu()

```
template<typename T >
LU_result< T > Mtx::lu (
            const Matrix< T > & A )
```

LU decomposition.

Performs LU factorization of the matrix into the the product of a lower triangular matrix *L* and an upper triangular matrix *U*.
This function implements LU factorization without pivoting. Use lup() if pivoting is required.
More information: https://en.wikipedia.org/wiki/LU_decomposition

Parameters

A	input square matrix to be decomposed

Returns

structure containing calculated *L* and *U* matrices

References Mtx::Matrix< T >::cols(), Mtx::LU_result< T >::L, Mtx::lu(), Mtx::Matrix< T >::numel(), Mtx::Matrix< T >::rows(), and Mtx::LU_result< T >::U.

Referenced by Mtx::lu().

6.2.1.40 lup()

```
template<typename T >
LUP_result< T > Mtx::lup (
            const Matrix< T > & A )
```

LU decomposition with pivoting.

Performs LU factorization with partial pivoting, employing column permutations.
The input matrix can be re-created from *L*, *U* and *P* using permute_cols() accordingly:

```
auto r = lup(A);
auto A_rec = permute_cols(r.L * r.U, r.P);
```

More information: https://en.wikipedia.org/wiki/LU_decomposition#LU_factorization↩_with_partial_pivoting

Parameters

A	input square matrix to be decomposed

Returns

structure containing *L*, *U* and *P*.

References Mtx::Matrix< T >::cols(), Mtx::LUP_result< T >::L, Mtx::lup(), Mtx::Matrix< T >::numel(), Mtx::LUP_result< T >::P, Mtx::Matrix< T >::rows(), and Mtx::LUP_result< T >::U.

Referenced by Mtx::det_lu(), Mtx::inv_square(), Mtx::lup(), and Mtx::solve_square().

6.2.1.41 make_complex() [1/2]

```
template<typename T >
Matrix< std::complex< T > > Mtx::make_complex (
            const Matrix< T > & Re )
```

Create complex matrix from real matrix.

Constructs a matrix of std::complex type from real and imaginary matrices.

Parameters

Re	real part matrix

Returns

complex matrix with real part set to *Re* and imaginary part to zero

References Mtx::Matrix< T >::cols(), Mtx::make_complex(), Mtx::Matrix< T >::numel(), and Mtx::Matrix< T >::rows().

6.2.1.42 make_complex() [2/2]

```
template<typename T >
Matrix< std::complex< T > > Mtx::make_complex (
            const Matrix< T > & Re,
            const Matrix< T > & Im )
```

Create complex matrix from real and imaginary matrices.

Constructs a matrix of std::complex type from real matrices providing real and imaginary parts. *Re* and *Im* matrices must have the same dimensions.

Parameters

Re	real part matrix
Im	imaginary part matrix

Returns

complex matrix with real part set to *Re* and imaginary part to *Im*

Exceptions

std::runtime_error	when *Re* and *Im* have different dimensions

References Mtx::Matrix< T >::cols(), Mtx::make_complex(), Mtx::Matrix< T >::numel(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::eigenvalues(), Mtx::make_complex(), and Mtx::make_complex().

6.2.1.43 mult() [1/4]

```
template<typename T , bool transpose_first = false, bool transpose_second = false>
Matrix< T > Mtx::mult (
            const Matrix< T > & A,
            const Matrix< T > & B )
```

Matrix multiplication.

Performs multiplication of two matrices.

This function supports template parameterization of input matrix transposition, providing better efficiency than in case of using ctranspose() function due to zero-copy operation. In case of complex matrices, conjugate (Hermitian) transpose is used.

Template Parameters

transpose_first	if set to true, the left-side input matrix will be transposed during operation
transpose_second	if set to true, the right-side input matrix will be transposed during operation

Parameters

A	left-side matrix of size *N* x *M* (after transposition)
B	right-side matrix of size *M* x *K* (after transposition)

Returns

output matrix of size *N* x *K*

References Mtx::cconj(), Mtx::Matrix< T >::cols(), Mtx::mult(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::mult(), Mtx::mult(), Mtx::mult(), Mtx::mult(), Mtx::operator*(), Mtx::operator*(), Mtx::operator*(), Mtx::operator*(), and Mtx::operator*=().

6.2.1.44 mult() [2/4]

```
template<typename T >
std::vector< T > Mtx::mult (
            const Matrix< T > & A,
            const std::vector< T > & v )
```

Multiplication of matrix by std::vector.

Performs the right multiplication of a matrix with a column vector represented by std::vector. The result of the operation is also a std::vector.

Parameters

A	input matrix of size *N* x *M*
v	std::vector of size *M*

Returns

std::vector of size *N* being the result of multiplication

References Mtx::Matrix< T >::cols(), Mtx::mult(), and Mtx::Matrix< T >::rows().

6.2.1.45 mult() [3/4]

```
template<typename T >
Matrix< T > Mtx::mult (
            const Matrix< T > & A,
            T s )
```

Multiplication of matrix by scalar.

Multiplies each element of the input matrix by a scalar s. This method does not modify the input matrix but creates a copy.

References Mtx::Matrix< T >::cols(), Mtx::mult(), Mtx::Matrix< T >::numel(), and Mtx::Matrix< T >::rows().

6.2.1.46 mult() [4/4]

```
template<typename T >
std::vector< T > Mtx::mult (
            const std::vector< T > & v,
            const Matrix< T > & A )
```

Multiplication of std::vector by matrix.

Performs the left multiplication of a std::vector with a matrix. The result of the operation is also a std::vector.

Parameters

v	std::vector of size *N*
A	input matrix of size *N* x *M*

Returns

std::vector of size *M* being the result of multiplication

References Mtx::Matrix< T >::cols(), Mtx::mult(), and Mtx::Matrix< T >::rows().

6.2.1.47 mult_hadamard()

```
template<typename T , bool transpose_first = false, bool transpose_second = false>
Matrix< T > Mtx::mult_hadamard (
            const Matrix< T > & A,
            const Matrix< T > & B )
```

Matrix Hadamard (elementwise) multiplication.

Performs Hadamard (elementwise) multiplication of two matrices.

This function supports template parameterization of input matrix transposition, providing better efficiency than in case of using ctranspose() function due to zero-copy operation. In case of complex matrices, conjugate (Hermitian) transpose is used.

Template Parameters

transpose_first	if set to true, the left-side input matrix will be transposed during operation
transpose_second	if set to true, the right-side input matrix will be transposed during operation

Parameters

A	left-side matrix of size *N* x *M* (after transposition)
B	right-side matrix of size *N* x *M* (after transposition)

Returns

output matrix of size *N* x *M*

References Mtx::cconj(), Mtx::Matrix< T >::cols(), Mtx::mult_hadamard(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::mult_hadamard(), and Mtx::operator^().

6.2.1.48 norm_fro() [1/2]

```
template<typename T >
double Mtx::norm_fro (
            const Matrix< std::complex< T > > & A )
```

Frobenius norm of complex matrix.

Calculates Frobenius norm of complex matrix.
More information: https://en.wikipedia.org/wiki/Matrix_norm#Frobenius_norm

References Mtx::norm_fro().

6.2.1.49 norm_fro() [2/2]

```
template<typename T >
double Mtx::norm_fro (
            const Matrix< T > & A )
```

Frobenius norm.

Calculates Frobenius norm of real matrix.
More information https://en.wikipedia.org/wiki/Matrix_norm#Frobenius_norm

References Mtx::norm_fro(), and Mtx::Matrix< T >::numel().

Referenced by Mtx::cond(), Mtx::householder_reflection(), Mtx::norm_fro(), Mtx::norm_fro(), and Mtx::qr_red_gs().

6.2.1.50 ones() [1/2]

```
template<typename T >
Matrix< T > Mtx::ones (
            unsigned n ) [inline]
```

Square matrix of ones.

Construct a square matrix of size *n* x *n* and fill it with all elements set to 1.
In case of complex datatype, matrix is filled with $1 + 0i$.

Parameters

n	size of the square matrix (the first and the second dimension)

Returns

zeros matrix

References Mtx::ones().

6.2.1.51 ones() [2/2]

```
template<typename T >
Matrix< T > Mtx::ones (
            unsigned nrows,
            unsigned ncols ) [inline]
```

Matrix of ones.

Construct a matrix of size *nrows* x *ncols* and fill it with all elements set to 1.
In case of complex data types, matrix is filled with $1 + 0i$.

Parameters

nrows	number of rows (the first dimension)
ncols	number of columns (the second dimension)

Returns

ones matrix

References Mtx::ones().

Referenced by Mtx::ones(), and Mtx::ones().

6.2.1.52 operator"!=()

```
template<typename T >
bool Mtx::operator!= (
            const Matrix< T > & A,
            const Matrix< T > & b )  [inline]
```

Matrix non-equality check operator.

Returns true, if both matrices are not the same size or not all of the elements are equal value.

References Mtx::Matrix< T >::isequal(), and Mtx::operator!=().

Referenced by Mtx::operator!=().

6.2.1.53 operator*() [1/4]

```
template<typename T >
Matrix< T > Mtx::operator* (
            const Matrix< T > & A,
            const Matrix< T > & B )  [inline]
```

Matrix product.

Calculates matrix product of two matrices $A \cdot B$. A and B must be the same size.

References Mtx::mult(), and Mtx::operator*().

Referenced by Mtx::operator*(), Mtx::operator*(), Mtx::operator*(), and Mtx::operator*().

6.2.1.54 operator*() [2/4]

```
template<typename T >
std::vector< T > Mtx::operator* (
            const Matrix< T > & A,
            const std::vector< T > & v )  [inline]
```

Matrix and std::vector product.

Calculates product between a matrix and a std::vector $A \cdot v$.

References Mtx::mult(), and Mtx::operator*().

6.2.1.55 operator*() [3/4]

```
template<typename T >
Matrix< T > Mtx::operator* (
            const Matrix< T > & A,
            T s ) [inline]
```

Matrix product with scalar.

Multiplies each element of the matrix by a scalar s.

References Mtx::mult(), and Mtx::operator*().

6.2.1.56 operator*() [4/4]

```
template<typename T >
Matrix< T > Mtx::operator* (
            T s,
            const Matrix< T > & A ) [inline]
```

Matrix product with scalar.

Multiplies each element of the matrix by a scalar s.

References Mtx::mult(), and Mtx::operator*().

6.2.1.57 operator*=() [1/2]

```
template<typename T >
Matrix< T > & Mtx::operator*= (
            Matrix< T > & A,
            const Matrix< T > & B ) [inline]
```

Matrix product.

Calculates matrix product of two matrices $A \cdot B$. A and B must be the same size.

References Mtx::mult(), and Mtx::operator*=().

Referenced by Mtx::operator*=(), and Mtx::operator*=().

6.2.1.58 operator*=() [2/2]

```
template<typename T >
Matrix< T > & Mtx::operator*= (
            Matrix< T > & A,
            T s ) [inline]
```

Matrix product with scalar.

Multiplies each element of the matrix by a scalar s.

References Mtx::Matrix< T >::mult(), and Mtx::operator*=().

6.2.1.59 operator+() [1/3]

```
template<typename T >
Matrix< T > Mtx::operator+ (
              const Matrix< T > & A,
              const Matrix< T > & B )  [inline]
```

Matrix sum.

Calculates a sum of two matrices $A + B$. A and B must be the same size.

References Mtx::add(), and Mtx::operator+().

Referenced by Mtx::operator+(), Mtx::operator+(), and Mtx::operator+().

6.2.1.60 operator+() [2/3]

```
template<typename T >
Matrix< T > Mtx::operator+ (
              const Matrix< T > & A,
              T s )  [inline]
```

Matrix sum with scalar.

Adds a scalar *s* to each element of the matrix.

References Mtx::add(), and Mtx::operator+().

6.2.1.61 operator+() [3/3]

```
template<typename T >
Matrix< T > Mtx::operator+ (
              T s,
              const Matrix< T > & A )  [inline]
```

Matrix sum with scalar. Adds a scalar s to each element of the matrix.

References Mtx::add(), and Mtx::operator+().

6.2.1.62 operator+=() [1/2]

```
template<typename T >
Matrix< T > & Mtx::operator+= (
              Matrix< T > & A,
              const Matrix< T > & B )  [inline]
```

Matrix sum.

Calculates a sum of two matrices $A + B$. A and B must be the same size.

References Mtx::Matrix< T >::add(), and Mtx::operator+=().

Referenced by Mtx::operator+=(), and Mtx::operator+=().

6.2.1.63 operator+=() [2/2]

```
template<typename T >
Matrix< T > & Mtx::operator+= (
            Matrix< T > & A,
            T s ) [inline]
```

Matrix sum with scalar.

Adds a scalar s to each element of the matrix.

References Mtx::Matrix< T >::add(), and Mtx::operator+=().

6.2.1.64 operator-() [1/2]

```
template<typename T >
Matrix< T > Mtx::operator- (
            const Matrix< T > & A,
            const Matrix< T > & B ) [inline]
```

Matrix subtraction.

Calculates a subtraction of two matrices $A - B$. A and B must be the same size.

References Mtx::operator-(), and Mtx::subtract().

Referenced by Mtx::operator-(), and Mtx::operator-().

6.2.1.65 operator-() [2/2]

```
template<typename T >
Matrix< T > Mtx::operator- (
            const Matrix< T > & A,
            T s ) [inline]
```

Matrix subtraction with scalar.

Subtracts a scalar s from each element of the matrix.

References Mtx::operator-(), and Mtx::subtract().

6.2.1.66 operator-=() [1/2]

```
template<typename T >
Matrix< T > & Mtx::operator-= (
            Matrix< T > & A,
            const Matrix< T > & B ) [inline]
```

Matrix subtraction.

Subtracts two matrices $A - B$. A and B must be the same size.

References Mtx::operator-=(), and Mtx::Matrix< T >::subtract().

Referenced by Mtx::operator-=(), and Mtx::operator-=().

6.2.1.67 operator-=() [2/2]

```
template<typename T >
Matrix< T > & Mtx::operator-= (
            Matrix< T > & A,
            T s ) [inline]
```

Matrix subtraction with scalar.

Subtracts a scalar s from each element of the matrix.

References Mtx::operator-=(), and Mtx::Matrix< T >::subtract().

6.2.1.68 operator/()

```
template<typename T >
Matrix< T > Mtx::operator/ (
            const Matrix< T > & A,
            T s ) [inline]
```

Matrix division by scalar.

Divides each element of the matrix by a scalar s.

References Mtx::div(), and Mtx::operator/().

Referenced by Mtx::operator/().

6.2.1.69 operator/=()

```
template<typename T >
Matrix< T > & Mtx::operator/= (
            Matrix< T > & A,
            T s ) [inline]
```

Matrix division by scalar.

Divides each element of the matrix by a scalar s.

References Mtx::Matrix< T >::div(), and Mtx::operator/=().

Referenced by Mtx::operator/=().

6.2.1.70 operator<<()

```
template<typename T >
std::ostream & Mtx::operator<< (
            std::ostream & os,
            const Matrix< T > & A )
```

Matrix ostream operator.

Formats a string incorporating the elements of a matrix. Elements within the same row are separated by space sign ' '. Different rows are separated by the endline delimiters.

References Mtx::Matrix< T >::cols(), Mtx::operator<<(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::operator<<().

6.2.1.71 operator==()

```
template<typename T >
bool Mtx::operator== (
            const Matrix< T > & A,
            const Matrix< T > & b ) [inline]
```

Matrix equality check operator.

Returns true, if both matrices are the same size and all of the element are equal value.

References Mtx::Matrix< T >::isequal(), and Mtx::operator==().

Referenced by Mtx::operator==().

6.2.1.72 operator^()

```
template<typename T >
Matrix< T > Mtx::operator^ (
            const Matrix< T > & A,
            const Matrix< T > & B ) [inline]
```

Matrix Hadamard product.

Calculates a Hadamard product of two matrices $A \otimes B$. A and B must be the same size. Hadamard product is calculated as an element-wise multiplication between the matrices.

References Mtx::mult_hadamard(), and Mtx::operator^().

Referenced by Mtx::operator^().

6.2.1.73 operator^=()

```
template<typename T >
Matrix< T > & Mtx::operator^= (
            Matrix< T > & A,
            const Matrix< T > & B ) [inline]
```

Matrix Hadamard product.

Calculates a Hadamard product of two matrices $A \otimes B$. A and B must be the same size. Hadamard product is calculated as an element-wise multiplication between the matrices.

References Mtx::Matrix< T >::mult_hadamard(), and Mtx::operator^=().

Referenced by Mtx::operator^=().

6.2.1.74 permute_cols()

```
template<typename T >
Matrix< T > Mtx::permute_cols (
            const Matrix< T > & A,
            const std::vector< unsigned > perm )
```

Permute columns of the matrix.

Creates a copy of the matrix with permutation of columns specified as input parameter. Each column in the new matrix is a copy of respective column from the input matrix indexed by permutation vector. The size of the output matrix is *A.rows()* x *perm.size()*.

Parameters

A	input matrix
perm	permutation vector with column indices

Returns

output matrix created by column permutation of *A*

Exceptions

std::runtime_error	when permutation vector is empty
std::out_of_range	when any index in permutation vector is out of range

References Mtx::Matrix< T >::cols(), Mtx::permute_cols(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::permute_cols().

6.2.1.75 permute_rows()

```
template<typename T >
Matrix< T > Mtx::permute_rows (
            const Matrix< T > & A,
            const std::vector< unsigned > perm )
```

Permute rows of the matrix.

Creates a copy of the matrix with permutation of rows specified as input parameter. Each row in the new matrix is a copy of respective row from the input matrix indexed by permutation vector. The size of the output matrix is *perm.size()* x *A.cols()*.

Parameters

A	input matrix
perm	permutation vector with row indices

Returns

output matrix created by row permutation of *A*

Exceptions

std::runtime_error	when permutation vector is empty
std::out_of_range	when any index in permutation vector is out of range

References Mtx::Matrix< T >::cols(), Mtx::permute_rows(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::inv_square(), Mtx::permute_rows(), and Mtx::solve_square().

6.2.1.76 pinv()

```
template<typename T >
Matrix< T > Mtx::pinv (
            const Matrix< T > & A )
```

Moore-Penrose pseudoinverse.

Calculates the Moore-Penrose pseudoinverse A^+ of a matrix A.
If A has linearly independent columns, the pseudoinverse is a left inverse, that is $A^+A = I$, and $A^+ = (A'A)^{-1}A'$.
If A has linearly independent rows, the pseudoinverse is a right inverse, that is $AA^+ = I$, and $A^+ = A'(AA')^{-1}$.
More information: https://en.wikipedia.org/wiki/Moore%E2%80%93Penrose_inverse

References Mtx::Matrix< T >::cols(), Mtx::inv_posdef(), Mtx::pinv(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::pinv().

6.2.1.77 qr()

```
template<typename T >
QR_result< T > Mtx::qr (
            const Matrix< T > & A,
            bool calculate_Q = true )  [inline]
```

QR decomposition.

The QR decomposition is a decomposition of a matrix A into a product $A = QR$ of an orthonormal matrix Q and an upper triangular matrix R.
Currently, this function is a wrapper around qr_householder(). Refer to qr_red_gs() for alternative implementation.

Parameters

A	input matrix to be decomposed
calculate←_Q	indicates if *Q* to be calculated

Returns

structure encapsulating calculated *Q* of size *n* x *n* and *R* of size *n* x *m*. *Q* is calculated only when *calculate_Q* = True.

References Mtx::qr(), and Mtx::qr_householder().

Referenced by Mtx::eigenvalues(), and Mtx::qr().

6.2.1.78 qr_householder()

```
template<typename T >
QR_result< T > Mtx::qr_householder (
            const Matrix< T > & A,
            bool calculate_Q = true )
```

QR decomposition based on Householder method.

The QR decomposition is a decomposition of a matrix A into a product $A = QR$ of an orthonormal matrix Q and an upper triangular matrix R.
This function implements QR decomposition based on Householder reflections method.
More information: https://en.wikipedia.org/wiki/QR_decomposition

Parameters

A	input matrix to be decomposed, size *n* x *m*
calculate←_Q	indicates if *Q* to be calculated

Returns

structure encapsulating calculated *Q* of size *n* x *n* and *R* of size *n* x *m*. *Q* is calculated only when *calculate_Q* = True.

References Mtx::Matrix< T >::cols(), Mtx::householder_reflection(), Mtx::QR_result< T >::Q, Mtx::qr_householder(), Mtx::QR_result< T >::R, and Mtx::Matrix< T >::rows().

Referenced by Mtx::qr(), and Mtx::qr_householder().

6.2.1.79 qr_red_gs()

```
template<typename T >
QR_result< T > Mtx::qr_red_gs (
            const Matrix< T > & A )
```

Reduced QR decomposition based on Gram-Schmidt method.

The QR decomposition is a decomposition of a matrix A into a product $A = QR$ of an orthonormal matrix Q and an upper triangular matrix R.
This function implements the reduced QR decomposition based on Gram-Schmidt method.
More information: https://en.wikipedia.org/wiki/QR_decomposition

Parameters

A	input matrix to be decomposed, size *n* x *m*

Returns

structure encapsulating calculated *Q* of size *n* x *m*, and *R* of size *m* x *m*.

Exceptions

singular_matrix_exception	when division by 0 is encountered during computation

References Mtx::cconj(), Mtx::Matrix< T >::cols(), Mtx::Matrix< T >::get_submatrix(), Mtx::norm_fro(), Mtx::QR_result< T >::Q, Mtx::qr_red_gs(), Mtx::QR_result< T >::R, and Mtx::Matrix< T >::rows().

Referenced by Mtx::qr_red_gs().

6.2.1.80 real()

```
template<typename T >
Matrix< T > Mtx::real (
            const Matrix< std::complex< T > > & C )
```

Get real part of complex matrix.

Constructs a matrix of real type from std::complex matrix by taking its real part.

References Mtx::real().

Referenced by Mtx::real().

6.2.1.81 repmat()

```
template<typename T >
Matrix< T > Mtx::repmat (
            const Matrix< T > & A,
            unsigned m,
            unsigned n )
```

Repeat matrix.

Form a block matrix of size *m* by *n*, with a copy of matrix A as each element.

Parameters

A	input matrix to be repeated
m	number of times to repeat matrix A in vertical dimension (rows)
n	number of times to repeat matrix A in horizontal dimension (columns)

References Mtx::Matrix< T >::cols(), Mtx::repmat(), and Mtx::Matrix< T >::rows().

Referenced by Mtx::repmat().

6.2.1.82 solve_posdef()

```
template<typename T >
Matrix< T > Mtx::solve_posdef (
            const Matrix< T > & A,
            const Matrix< T > & B )
```

Solves the positive definite (Hermitian) system.

Return the matrix left division of *A* and *B*, where *A* is positive definite matrix. It is equivalent to solving the system
$A \cdot X = B$
with respect to X. The system is solved for each column of *B* using Cholesky decomposition followed by forward and backward propagation.
A minimum norm solution is computed if the coefficient matrix is singular.

Parameters

A	left side matrix of size *N* x *N*. Must be square and positive definite.
B	right hand side matrix of size *N* x *M*.

Returns

solution matrix of size *N* x *M*.

Exceptions

std::runtime_error	when the input matrix is not square
std::runtime_error	when number of rows is not equal between input matrices
singular_matrix_exception	when the input matrix is singular (detected as division by 0 during computation)

References Mtx::chol(), Mtx::Matrix< T >::issquare(), Mtx::Matrix< T >::numel(), Mtx::Matrix< T >::rows(), Mtx::solve_posdef(), Mtx::solve_tril(), and Mtx::solve_triu().

Referenced by Mtx::solve_posdef().

6.2.1.83 solve_square()

```
template<typename T >
Matrix< T > Mtx::solve_square (
            const Matrix< T > & A,
            const Matrix< T > & B )
```

Solves the square system.

Return the matrix left division of *A* and *B*, where *A* is square. It is equivalent to solving the system $A \cdot X = B$ with respect to X. The system is solved for each column of *B* using LU decomposition followed by forward and backward propagation.
A minimum norm solution is computed if the coefficient matrix is singular.

Parameters

A	left side matrix of size *N* x *N*. Must be square.
B	right hand side matrix of size *N* x *M*.

Returns

solution matrix of size *N* x *M*.

Exceptions

std::runtime_error	when the input matrix is not square
std::runtime_error	when number of rows is not equal between input matrices
singular_matrix_exception	when the input matrix is singular (detected as division by 0 during computation)

References Mtx::Matrix< T >::issquare(), Mtx::lup(), Mtx::Matrix< T >::numel(), Mtx::permute_rows(), Mtx::Matrix< T >::rows(), Mtx::solve_square(), Mtx::solve_tril(), and Mtx::solve_triu().

Referenced by Mtx::solve_square().

6.2.1.84 solve_tril()

```
template<typename T >
Matrix< T > Mtx::solve_tril (
            const Matrix< T > & L,
            const Matrix< T > & B )
```

Solves the lower triangular system.

Return the matrix left division of *L* and *B*, where *L* is square and lower triangular. It is equivalent to solving the system $L \cdot X = B$ with respect to X. The system is solved for each column of *B* using forwards substitution. A minimum norm solution is computed if the coefficient matrix is singular.

Parameters

L	left side matrix of size *N* x *N*. Must be square and lower triangular
B	right hand side matrix of size *N* x *M*.

Returns

X solution matrix of size *N* x *M*.

Exceptions

std::runtime_error	when the input matrix is not square
std::runtime_error	when number of rows is not equal between input matrices
singular_matrix_exception	when the input matrix is singular (detected as division by 0 during computation)

References Mtx::Matrix< T >::cols(), Mtx::Matrix< T >::issquare(), Mtx::Matrix< T >::numel(), Mtx::Matrix< T >::rows(), and Mtx::solve_tril().

Referenced by Mtx::solve_posdef(), Mtx::solve_square(), and Mtx::solve_tril().

6.2.1.85 solve_triu()

```
template<typename T >
Matrix< T > Mtx::solve_triu (
            const Matrix< T > & U,
            const Matrix< T > & B )
```

Solves the upper triangular system.

Return the matrix left division of *U* and *B*, where *U* is square and upper triangular. It is equivalent to solving the system $U \cdot X = B$ with respect to X. The system is solved for each column of *B* using backwards substitution. A minimum norm solution is computed if the coefficient matrix is singular.

Parameters

U	left side matrix of size *N* x *N*. Must be square and upper triangular
B	right hand side matrix of size *N* x *M*.

Returns

solution matrix of size *N* x *M*.

Exceptions

std::runtime_error	when the input matrix is not square
std::runtime_error	when number of rows is not equal between input matrices
singular_matrix_exception	when the input matrix is singular (detected as division by 0 during computation)

References Mtx::Matrix< T >::cols(), Mtx::Matrix< T >::issquare(), Mtx::Matrix< T >::numel(), Mtx::Matrix< T >::rows(), and Mtx::solve_triu().

Referenced by Mtx::solve_posdef(), Mtx::solve_square(), and Mtx::solve_triu().

6.2.1.86 subtract() [1/2]

```
template<typename T , bool transpose_first = false, bool transpose_second = false>
Matrix< T > Mtx::subtract (
            const Matrix< T > & A,
            const Matrix< T > & B )
```

Matrix subtraction.

Performs subtraction of two matrices.

This function supports template parameterization of input matrix transposition, providing better efficiency than in case of using ctranspose() function due to zero-copy operation. In case of complex matrices, conjugate (Hermitian) transpose is used.

Template Parameters

transpose_first	if set to true, the left-side input matrix will be transposed during operation
transpose_second	if set to true, the right-side input matrix will be transposed during operation

Parameters

A	left-side matrix of size *N* x *M* (after transposition)
B	right-side matrix of size *N* x *M* (after transposition)

Returns

output matrix of size *N* x *M*

References Mtx::cconj(), Mtx::Matrix< T >::cols(), Mtx::Matrix< T >::rows(), and Mtx::subtract().

Referenced by Mtx::operator-(), Mtx::operator-(), Mtx::subtract(), and Mtx::subtract().

6.2.1.87 subtract() [2/2]

```
template<typename T >
Matrix< T > Mtx::subtract (
            const Matrix< T > & A,
            T s )
```

Subtraction of scalar from matrix.

Subtracts a scalar s from each element of the input matrix. This method does not modify the input matrix but creates a copy.

References Mtx::Matrix< T >::cols(), Mtx::Matrix< T >::numel(), Mtx::Matrix< T >::rows(), and Mtx::subtract().

6.2.1.88 trace()

```
template<typename T >
T Mtx::trace (
            const Matrix< T > & A )
```

Matrix trace.

Calculates trace of a matrix by summing the elements on the diagonal.

$$\mathrm{tr})(A) = \sum_{n=0}^{N-1} [A]_{n,n}$$

References Mtx::Matrix< T >::rows(), and Mtx::trace().

Referenced by Mtx::trace().

6.2.1.89 transpose()

```
template<typename T >
Matrix< T > Mtx::transpose (
            const Matrix< T > & A )   [inline]
```

Transpose a matrix.

Returns a matrix that is a transposition of an input matrix.

References Mtx::Matrix< T >::transpose(), and Mtx::transpose().

Referenced by Mtx::transpose().

6.2.1.90 tril()

```
template<typename T >
Matrix< T > Mtx::tril (
            const Matrix< T > & A )
```

Extract triangular lower part.

Return a new matrix formed by extracting the lower triangular part of the input matrix, and setting all other elements to zero.

References Mtx::Matrix< T >::cols(), Mtx::Matrix< T >::rows(), and Mtx::tril().

Referenced by Mtx::chol(), and Mtx::tril().

6.2.1.91 triu()

```
template<typename T >
Matrix< T > Mtx::triu (
            const Matrix< T > & A )
```

Extract triangular upper part.

Return a new matrix formed by extracting the upper triangular part of the input matrix, and setting all other elements to zero.

References Mtx::Matrix< T >::cols(), Mtx::Matrix< T >::rows(), and Mtx::triu().

Referenced by Mtx::triu().

6.2.1.92 wilkinson_shift()

```
template<typename T >
std::complex< T > Mtx::wilkinson_shift (
            const Matrix< std::complex< T > > & H,
            T tol = 1e-10 )
```

Wilkinson's shift for complex eigenvalues.

Computes Wilkinson's shift value *mu* for complex eigenvalues of input matrix. Wilkinson's shift is calculated as eigenvalue of the bottom 2 x 2 principal minor closest to the corner entry of the matrix.
Input must be a square matrix in Hessenberg form.

Exceptions

std::runtime_error	when the input matrix is not square

References Mtx::wilkinson_shift().

Referenced by Mtx::eigenvalues(), and Mtx::wilkinson_shift().

6.2.1.93 zeros() [1/2]

```
template<typename T >
Matrix< T > Mtx::zeros (
             unsigned n )  [inline]
```

Square matrix of zeros.

Construct a square matrix of size *n* x *n* and fill it with all elements set to 0.

Parameters

n	size of the square matrix (the first and the second dimension)

Returns

zeros matrix

References Mtx::zeros().

6.2.1.94 zeros() [2/2]

```
template<typename T >
Matrix< T > Mtx::zeros (
             unsigned nrows,
             unsigned ncols )  [inline]
```

Matrix of zeros.

Create a matrix of size *nrows* x *ncols* and fill it with all elements set to 0.

Parameters

nrows	number of rows (the first dimension)
ncols	number of columns (the second dimension)

Returns

zeros matrix

References Mtx::zeros().

Referenced by Mtx::zeros(), and Mtx::zeros().
